

Forestry and Peatlands: Research Update

Russell Anderson & Ainoa Pravia

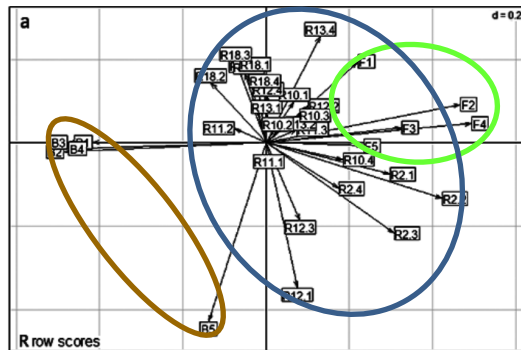

Biodiversity

Restoration trajectory of carabid functional traits in a formerly afforested blanket bog

Pravia, Andersen, Artz, Pakeman & Littlewood. *Acta Zoologica Academiae Scientiarum Hungaricae*, 2019.

Moth responses to forest-to-bog restoration

Pravia, A., Andersen, Artz, Boyd, Cowie, & Littlewood. *Mires and Peat*, 2020.

After two decades, restoration sites continue to support carabid communities with higher dispersal capacity and more diurnal activity than those of open bog.

A lack of recovery of typical blanket bog vegetation and microhabitat following felling to waste and drain blocking appear to limit carabid functional recovery.

The moth communities of restoration treatments resembled the bog community within a few years following onset of restoration.

Biodiversity

Ecological resistance of restored peatlands to climate change

Loisel & Gallego-Sala, Communications Earth and Environment 2022.

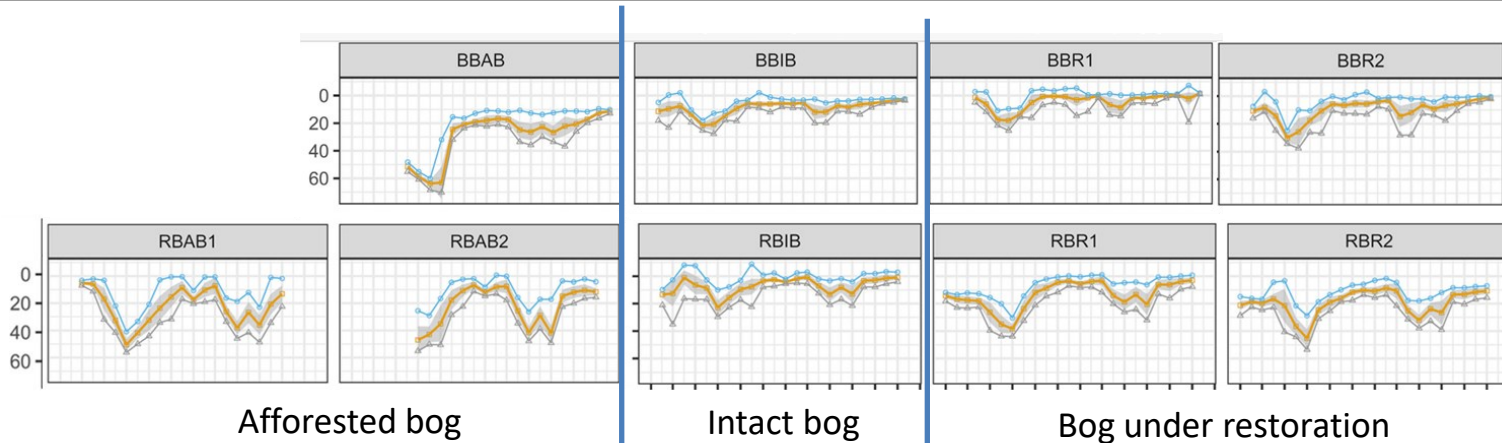

Review shows that vegetation and microbial diversity likely decrease after drainage ... this decreases the ability of the affected peatland to cope with stressors (e.g. climate change).

Peatland biodiversity has been a poorly-funded research field.
This justifies greater investment.

Water

The effect of forest-to-bog restoration on the hydrological functioning of raised and blanket bogs

Howson, Chapman, Shah, Anderson & Holden. *Ecohydrology*, 2021.

- Evapotranspiration greater in Afforested than Intact
- Water levels lower in Afforested than Intact
- Water table fluctuated more in Afforested than Intact
- Overland flow less in Afforested than Intact
- Restored bog generally intermediate

Effect of restoration on flooding needs further research

Water Quality

The effects of forest clearance for peatland restoration on water quality

Shah & Nisbett. Science of the Total Environment, 2019.

Larger-scale catchment felling for peatland restoration led to high $\text{PO}_4\text{-P}$ concentrations in streamwater; DOC, suspended solids and colour also increased.

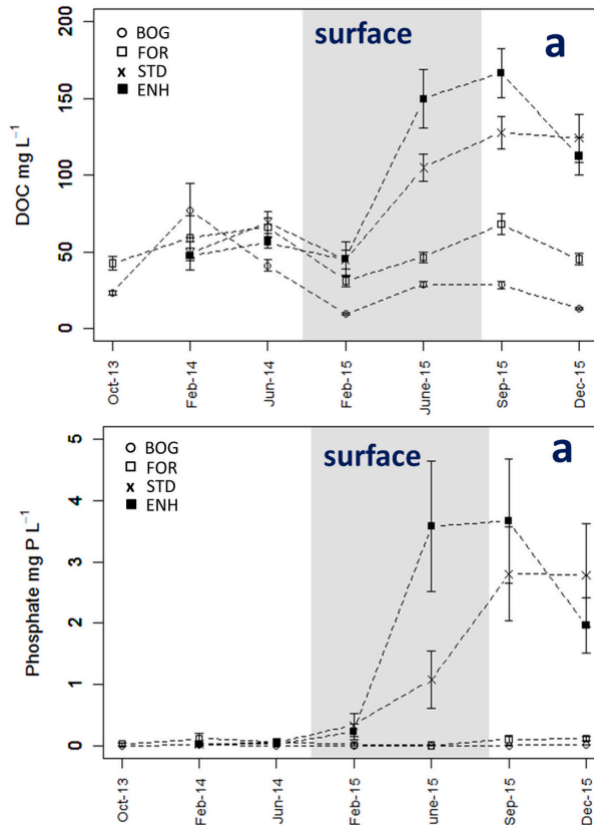

Phased felling and less intensive harvesting techniques reduced the impact on water quality; limited rise in $\text{PO}_4\text{-P}$ and DOC concentrations.

Water Quality

Restoration of afforested peatland: Effects on pore- and surface-water quality in relation to differing harvesting methods

Gaffney, Hancock, Taggart & Andersen, Ecological Engineering, 2022.

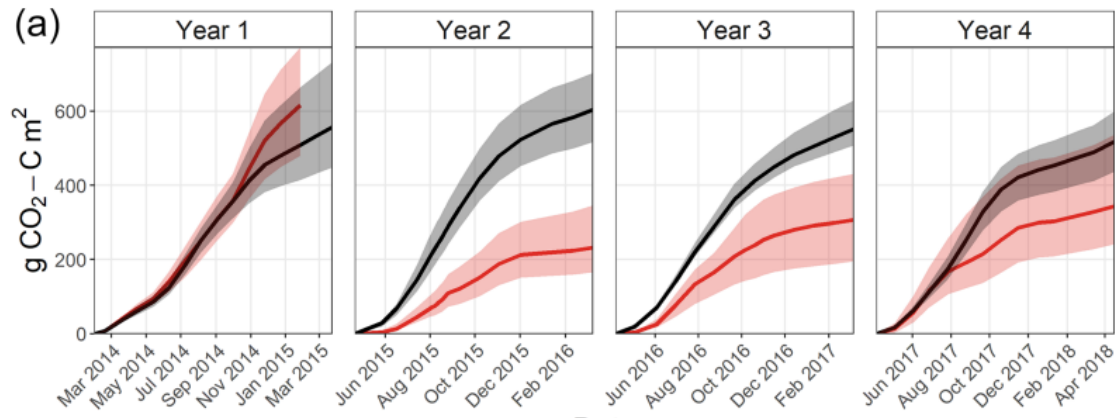

Although longer-term monitoring would be required to test this, our results suggest that there remains merit in removing brash (compared to stem-only harvest) when considering longer-term recovery to bog.

Restoration techniques are still evolving – useful finding here.

Greenhouse gases

Effects of clear-fell harvesting on soil CO₂, CH₄, and N₂O fluxes in an upland Sitka spruce stand in England.

Yamulki, Forster, Xenakis, Ash, Brunt, Perks & Morison. Biogeosciences, 2021.

On shallow peat, over 3 years following clear-fell, soil GHG emission (CO₂ equivalents basis) reduced by 45% due to much larger reduction in CO₂ than the combined increases in CH₄ and N₂O.

Greenhouse gases

Seasonal patterns of greenhouse gas emissions from a forest-to-bog restored site in northern Scotland: Influence of microtopography and vegetation on carbon dioxide and methane dynamics

Mazzola, Perks, Smith, Yeluripati & Xenakis. *European Journal of Soil Science*, 2020.

The original surface was near greenhouse gas equilibrium, at $-0.28 \text{ g CO}_2\text{eq m}^{-2} \text{ day}^{-1}$.

Microtopographic features were a net sink (ridges = $-0.94 \text{ g CO}_2\text{eq m}^{-2} \text{ day}^{-1}$, furrows = $-0.86 \text{ g CO}_2\text{eq m}^{-2} \text{ day}^{-1}$).

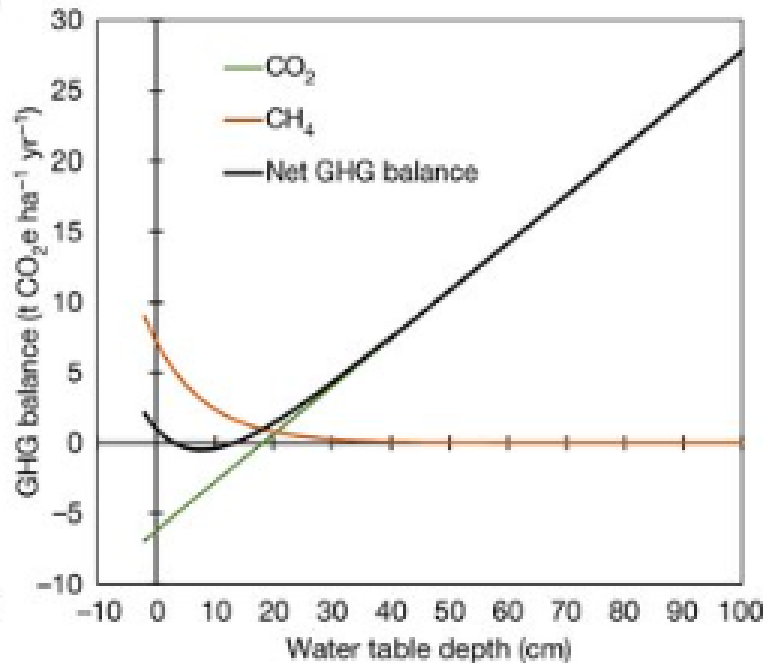

Bog pool was a net source ($0.98 \text{ g CO}_2\text{eq m}^{-2} \text{ day}^{-1}$).

Greenhouse gases

Overriding water table control on managed peatland greenhouse gas emissions.

Evans et al. (31 authors). Nature, 2021

Water-table depth (i.e. the average depth of the aerated peat layer) overrides all other ecosystem- and management-related controls on greenhouse gas fluxes.

Every 10 cm of reduction in depth could reduce the net warming impact of CO₂ and CH₄ emissions by at least 3 t CO₂e ha⁻¹ yr⁻¹, until depth is < 30 cm.

Raising water levels further would continue to have a net cooling effect until depth is < 10 cm.

Greenhouse gases

Net soil carbon balance in afforested peatlands and separating autotrophic and heterotrophic soil CO₂ effluxes

Hermans, McKenzie, Andersen, Teh, Cowie & Subke. Biogeosciences, 2022.

Soils in these 30-year-old drained and afforested peatlands are a net sink for C since substantially more C enters the soil organic matter than is decomposed heterotrophically.

Carbon balance

Carbon balance of Northern Ireland Forest Service forest on deep peat. Forest Research Report, March 2021

Vanguelova, Broadmeadow, Randle, Yamulki & Morison, 2022.

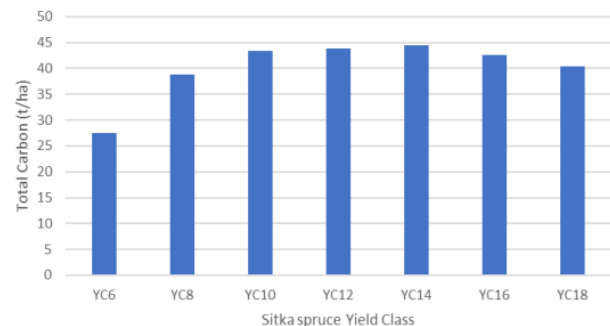

<https://www.daera-ni.gov.uk/forest-service-publications>

Carbon balance for Sitka spruce across YC with trench mounding (10% loss of peat C from top 50 cm peat)

Replanting deep peats by trench mounding and second rotation stand of YC10 and higher could deliver a net carbon accumulation between 2 and 6 t C/ha (accounting for roundwood only).

Carbon balance for Sitka spruce across YC with patch scarification (5% loss of C from top 20 cm peat)

If a much lighter ground preparation techniques is applied such as patch scarification ... the carbon balance of Sitka spruce will be positive across all yield classes.

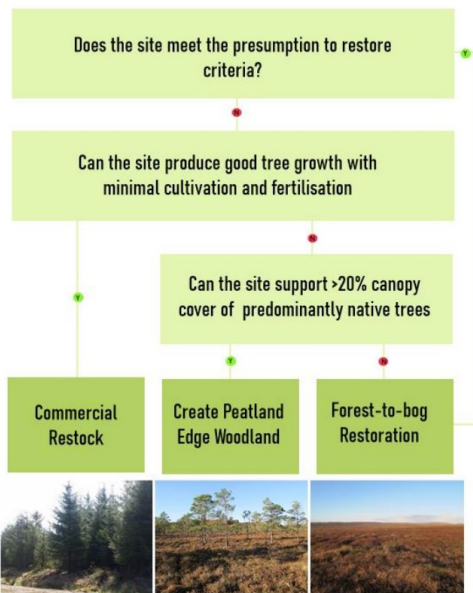

Land use

Is Peatland Edge Woodland an appropriate management option for afforested peatlands after harvesting?

Barrop. PhD thesis, University of York, 2022.

Assessing soil carbon dioxide and methane fluxes from a Scots pine raised bog-edge-woodland

Mazzola, Perks, Smith, Yeluripati & Xenakis. Journal of Environmental Management, 2022

For some stakeholders, PEW is a useful concept for developing peatland management strategies.

PEW may be capable of providing climate change mitigation services.

Scots pine bog-edge-woodland may affect soil C fluxes around the trees, enhancing soil CO₂ emissions, while reducing CH₄ fluxes.

Time now for questions and discussion
